

Ilya Mois

Software Engineer · Tbilisi, Georgia (GMT+4) · Available for full-time remote roles

job.offers@mois.pro · github.com/mois-ilya · linkedin.com/in/moisilya · Russian (native), English (professional)

SUMMARY

An engineer for eight years: I design API schemas, write the backend services behind them, publish the SDKs, and build the clients that use them. The last two went into developer-facing products at Tonkeeper, where I rewrote two TonAPI SDK packages installed ~14k times a week, and tightened two passages of the TON Connect protocol spec where the wording let independent implementations disagree.

EXPERIENCE

Independent — Software Engineer

Mar 2026 – Present · Tbilisi · two private products, built solo

- **Expense splitting** — nothing is overwritten: changes are appended as events, so two people editing the same bill both land and any balance is derived rather than patched. Settlement math checked by property-based tests against a simpler reference implementation.
- **Receipt scanning** — a photo of a bill becomes line items everyone at the table claims at once, all on Cloudflare Workers with no origin server. A staged model pipeline reads it: the image becomes text up front, each stage falls back across vendors, and the arithmetic is checked against the receipt total before anyone is shown a number.

Tonkeeper — Software Engineer, Developer Platform & DX

Jun 2024 – Mar 2026 · Remote · TON Apps, the 23-person team behind a wallet with 12M+ MAU. Most of this work is public — repository links below.

- **Developer console** — sole developer for 21 months. Moved billing from TON to USDT with no hard cutover for existing users, and [replaced the legacy state layer](#) that had been firing redundant events and needless server requests, leaving the app flow sequential.
- **Also on the console** — webhooks management, pricing tiers, USDT payments, the analytics query builder and airdrop tooling.
- **Public API schema and its Go backend** — fixed a bug where code-generator defaults silently cleared fields on update. Contributed to TonAPI's OpenAPI spec, mostly the parts generated clients break on: 64-bit integers that lose precision in JavaScript, date formats, response types.
- **TypeScript SDK, ~14k weekly downloads** — sole maintainer since mid-2024; rewrote the packages and wrote the generator behind them: custom templates, int64 mapped to bigint, isomorphic output for browser and Node, one runtime dependency.
- **Docs and wallet** — wrote integration guides on transaction tracking, data signing and hash normalization. Shipped TON Connect fixes in Tonkeeper Web across web, desktop and extension, and handled third-party API failures so they no longer crashed the app.

Quintegro — Frontend Developer

Jul 2023 – May 2024 · Remote

- Reservation platform connecting hosts and guests; led development of its booking-change module.
- Defined the frontend-backend API contracts, generated TypeScript types from them, set up CI.

Minacu — Full Stack Engineer

Apr 2023 – Jul 2023 · Part-time, Remote

- Built streaming speech-to-text over gRPC, text analysis through the OpenAI API, and a Telegram integration via tdlb — Python and NestJS on the backend, Next.js on the frontend.

Upper Echelon Products — JavaScript Developer, then Technical Team Lead

Apr 2021 – Mar 2023 · Remote

- Standardised the frontend codebase and its architecture, mentored 5 junior developers, moved API documentation to Swagger.
- Promoted to lead: 3–5 engineers and 1–2 QA through about 11 releases. Built an Amazon Seller Central ingestion pipeline; migrated the backend from VPS to AWS with CI/CD.

Apptech — Software Engineer

Jul 2020 – Nov 2020 · Part-time, St Petersburg

- Built push notifications and real-time messaging on Firebase for the second version of a messenger app.

GET Information Technology — Software Engineer

Mar 2018 – Feb 2020 · St Petersburg

- Built Backbone/Marionette and ExtJS interfaces and the ColdFusion code that served their data.
- Introduced ESLint and Babel, with tooling to track their rollout across the codebase.

OPEN SOURCE

- **TON Connect specification** — two of my edits are in the [protocol spec](#): the address format in a sign-data response, and appDomain encoding.
- **Data signing** — implemented the SignData feature in @tonconnect/sdk, which lets a wallet sign arbitrary text, binary or TON cell payloads. Published [a TypeScript reference implementation](#).
- **Wallet capabilities** — added requiredFeatures and preferredFeatures to the SDK: an app declares what it needs, and incompatible wallets are filtered out before the user connects.

SKILLS

- **Languages & frontend** — TypeScript, JavaScript, Python, Go (reading, small fixes); React, Next.js, React Native
- **Backend & APIs** — Node.js, Fastify, NestJS, PostgreSQL, OpenAPI, REST, gRPC, webhooks, event sourcing
- **Cloud & testing** — Cloudflare Workers, Durable Objects, AWS, Docker, CI/CD; Vitest, fast-check, Testcontainers
- **Domain** — developer platforms and SDKs · payments and billing · Telegram Mini Apps and bots · blockchain

EDUCATION

MSc, High Technology and Economics of Innovation

2019 – 2021 · ITMO University

BSc, Information Systems and Technologies

2015 – 2019 · Herzen State Pedagogical University
